Cryolipolysis
Fat Freezing
Laser Lipolysis
40kHz cavitation
Radio-frequency (RF)
No Surgery Required
Non-Invasive
Fat Reduction

Cryolipolysis: Fat cells contain ‘triglyceride’, and in particularly low temperatures it is converted into a solid, which leads to the breaking down of those particular fat cells. Using advanced cooling technology to selectively target fat bulges, the System can eliminate the fat cells through a gradual process.

Lazer Lipolysis: Lazer Lipolysis is quickly growing in popularity due to the fact that it carries far fewer risks than liposuction and other surgical procedures, is far less invasive, and doesn’t result in down time or scarring

40KHz Cavitation: Through the use of 40KHz sound waves that are emitted into the body, friction is caused between the fat cells. This causes effective consumption of calories and moisture within the cells, reducing their size

Body Radio-Frequency: Using high-frequency electromagnetic wave therapy, or

RF Therapy: Promotes skin regeneration, but also causes fat cells to shrink and tightens the skin, resulting in a firmer, slimmed look.
